

How Do Infant Arm and Leg Movements Affect Developmental Milestones?

UCLA RESEARCHERS ARE LOOKING FOR INFANTS YOUNGER THAN 6 MONTHS OLD AT LOW OR ELEVATED RISK FOR AUTISM:

Infants are considered at **ELEVATED RISK** if they have:

- A sibling with Autism, **OR**
- A genetic risk for Autism based on a diagnosis of Tuberous Sclerosis Complex (TSC) or 22q11.2 deletion syndrome

Infants are considered at **LOW RISK** if they have:

- A sibling with Typical Development and no family history of Autism

WHAT IS THE PURPOSE?

- We are examining motor development in early infancy in order to identify the earliest predictors of Autism or developmental delay.

WHAT WILL I RECEIVE?

- Participating families will receive detailed written and verbal feedback on assessments.

Participation involves:

- **Monthly Home Visits** during your baby's first year.
 - **Monthly Remote Visits** via Zoom during the first and second year.
 - Follow-Ups at 24 and 36 months.
-
- Motor activity monitoring via wearable movement sensors.
 - Play-Based Motor assessments
 - Developmental assessments
